

## List of Features needed for MVP:

- **Repair Current Features:** Firstly modify the existing features to not run into edge cases:
  - I can't allow the user to reserve slots for dates that are in the past. This will ensure that the user has a sane and intuitive experience (this is the value proponent).
- **Data access:** Implement a better way to store and access data. I did this in the last assignment, but I have since made severe changes to the application core. I will need to re-implement this. Currently I'm storing it in an ArrayList, which is just a memory-leak waiting to happen. I would like to switch to a model where I store the data on the filesystem instead.
- **Offer Better UI:** Not a feature per se, but desperately needed nonetheless.
- **Better Comms:** After actually booking a slot, I need a popup message that confirms the booking. The UI currently lacks that.
